HERBAL CANCER CURE

NEXUS was one of the first magazines to give international exposure to the research of Dr Hulda Clark (see NEXUS, vol. 2, nos. 22, 23). We thought readers might like to read one of many success stories that have resulted from using Dr Clark's treatments.

"I used to practise medicine using unorthodox approaches in Scottsdale, Arizona, until I was set up by the authorities and lost my licence to practise there. I came to Ecuador, where there is freedom to treat as you see fit.

"One amazing case I have is a five-year-old boy with Ewing's sarcoma, with tumours in his armpit and chest wall. He made the rounds from Miami Children's Hospital to Johns Hopkins Medical Center, where he was operated on and given the maximum doses of chemotherapy and radiation. Finally, he was sent back to Ecuador to die.

"He arrived in my office with a catheter in one of the veins of his heart, where his mother could give him injections of morphine for his intense pain.

"I started him on increasing doses of anti-parasite herbs, according to the recommendations of Dr Hulda Clark (*The Cure For All Cancers; The Cure For All Diseases*). It is hard to believe, but this child was off morphine and the oral painkillers within 24 hours. His appetite

returned, and I took him off the junk food he had been allowed to eat.

"Within two weeks, he returned to the activities of a normal five-year-old. His tumours are regressing and his blood levels have returned to normal. His only medications consist of vitamins, herbs and enzymes.

"Had I been confronted with this case in the USA, the program I put him on would have resulted in board action, media criticism and possibly a malpractice suit.

"Saving one life was worth the misery I went through. (Signed) R. B., Ecuador."

THOUGHT-POWER

Pilots are testing a revolutionary new system that will enable them to fly planes using thought-power.

Dr Andrew Junker, a UK-based electrical engineer and neuro-physiologist, has spent 25 years working towards creating machines that can be controlled by the mind.

The Cyberlinks Interface allows the user to send thought commands through a headband, and works by interpreting an assortment of undulating electrical pulses emitted by the brain.

Dr Junker's company, Cyberlink Mind Systems, is planning to apply the device to commercial uses, such as wheelchair-steering for the disabled, and in aviation, with commercial and military pilots using the system to fly planes.

A basic Cyberlink system for disabled people to operate a typewriter/computer keyboard will be on sale by Christmas 1996 and is expected to cost about AUD\$1,500. A thought-powered wheelchair, the Cyberchair, will be available within a year, with a retail price of around AUD\$20,000.

Test pilots using a flight simulator dome at the Wright Patterson Air Force base in Ohio, USA, have already demonstrated that commercial and military jets can be flown hands-free using the Cyberlink system.

"SOUL CATCHER" IMPLANTS

British scientists are developing a concept for a computer chip which, when implanted into the skull behind the eye, will be able to record a person's every lifetime thought and sensation.

"This is the end of death," said Dr Chris Winter of British Telecom's artificial-life team. He predicts that within 30 years it will be possible to relive other people's lives by playing back their experiences on a computer. "By combining this information with a record of the person's genes, we could recreate a person physically, emotionally and spiritually."

Dr Winter and his team of scientists at BT's Martlesham Heath Laboratories, near Ipswich, call the chip "the Soul Catcher".

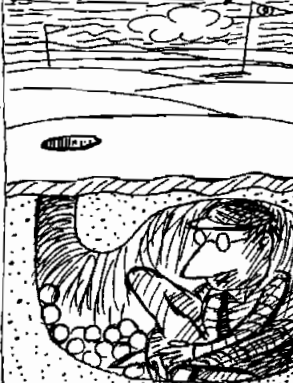

British Telecom would not divulge how much money it is investing in the project, but Dr Winter said it was taking "Soul

ACCOMMODATION

Self-contained studio. Big skylight. 360° views. Cool in summer.

Basement flat. Located in green belt. Hole in roof.

Penthouse. Fully detached. Deep pile carpets. Air conditional.

Catcher 2025" very seriously. He admitted there were profound ethical considerations, but emphasised that BT was embarking on this line of research so it could keep at the forefront of communications technology.

Dr Winter said, "An implanted chip would be like an aircraft's black box, and would enhance communications beyond current concepts. "For example, police would be able to use it to relive an attack, rape or murder from the victim's viewpoint, to help catch the criminal... I could even play back the smells, sounds and sights of my holiday to friends."

Other more frightening applications include downloading an older person's experiences into a newborn baby by transplanting the chip.

The device is expected to be on sale by 2025, so look out!

HUMAN TISSUE TO MAKE ANIMAL-TESTING REDUNDANT

The first pharmaceuticals company to test drugs exclusively on human tissue is to start business in October this year. Pharmagene, based in Hertfordshire, England, will only use human tissue and will not conduct any research on animals.

Animal rights groups see the move as a step in the right direction. "We've said for some time that the best science, as well as the most humane science, is based on examination of human rather than animal tissue," says Andrew Tyler, Director of the lobby group, Animal Aid. The group launched a donor card scheme in 1991 so that people could offer their tissue for research if/when they died. So far, over 250,000 people have joined the scheme.

ROTHSCHILD DEATH MYSTERY

Rumours abound as to the method of and motives for the death of Amschel Rothschild, heir to the fabulous Rothschild banking fortune.

Depending on which newspaper you read, his death has been reported as a suicide from hanging, a heart attack, a suicide from strangling, and a murder.

One news report stated that a massive media cover-up was ordered by magnate Rupert Murdoch, who allegedly faxed "his 600-odd editors and news managers around the world, ordering them to report Amschel's death as a heart attack, if at all".

British broadcast reporter, Ian Gooding, is quoted in the *Spotlight* as saying: "No one around here has ever seen such pressure to kill a front-page story. But in the end, the cover-up was complete."

Whatever the cause or reason, Amschel Rothschild's death is surrounded by mystery. His body was discovered on the bathroom floor of his suite at the luxurious *Hôtel Bristol* in Paris, at 7.32 pm on 8th July. French police found that he had been strangled with the end of the cord of his own bathrobe. One end of the cord was found attached to a towel rack, as if to suggest that his death was self-inflicted.

Many French reporters claim that the (French) police never called the death "suicide". Apparently, after photographing the body and the crime scene, one of the detectives gave the towel rack a sharp tug and it came right out of the wall.

No suicide note was found, and no discernible cause or reason appears to exist for a finding of suicide.

NZ SPY-BASE KEEPS POLITICIANS 'OUT OF THE LOOP'

New Zealand-based peace activist, Nicky Hager, has revealed in his new book, *Secret Power*, that NZ (and Australian) politicians, including the NZ Prime Minister, were kept uninformed on matters of intelligence-gathering and information-sharing.

(See Book Reviews this issue.) Former NZ Prime Minister David Lange states in the book's foreword that he had no idea New Zealand had been committed to an international, integrated, electronic network.

The book and the resulting media publicity sent the local intelligence community (an oxymoron, to be sure) into damage control. Their response, fed to the public through selected journalists, was to claim that the information contained in the book was already a matter of public record and, anyway, it probably wasn't very useful.

Mr Lange says, "...it is an outrage that I and other ministers were told so little, and this raises the question of to whom those concerned saw themselves ultimately answerable."

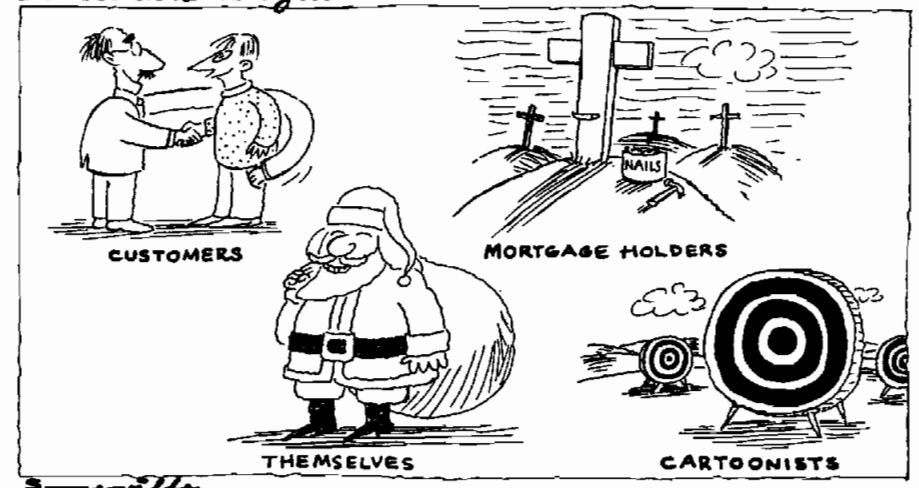

The surveillance system, revealed publicly for the first time, operates under the code-name *Echelon*, and falls under the secret pact known as the UKUSA Agreement (see NEXUS, vol. 2, no. 27).

It would appear from the disclosures in *Secret Power* that the *Echelon* network routinely intercepts civilian phone, fax and e-mail traffic, and shares this information with UKUSA member countries which include the USA, the UK, Canada, Australia and New Zealand.

Just who it is shared with in Australia and New Zealand is probably a matter of some debate behind the scenes right now.

Banks as seen by...

PHONICS FOR IMPROVING LITERACY SKILLS

A report produced by the Office for Standards in Education (Ofsted) in the UK, dramatically confirmed that the methods used by teachers to teach reading do not work. In fact, 80 per cent of pupils in 45 inner London primary schools could not read properly at the age of seven.

But the significance of the report goes even further than that. For the first time in a generation, it gives unequivocal official endorsement to phonics as the sole, effective foundation to the teaching of reading. It says that, instead of being taught to guess at words or recognise them by their shape, children should learn to sound them out.

According to the report, "Learning the letter-sound system of English comprises a set of knowledge and skills which is basic to learning to read and write an alphabetical script.

"Phonics provides pupils with the knowledge to decode and build words, upon which success in early reading and writing depends, and gives the pupils more confidence they need to tackle new texts."

The situation in the USA is even worse. After years of watching programs like *Sesame Street*, a whole generation of children has regressed in terms of literacy skills. This has led to a dramatic increase in the number of families adopting home-schooling—the only way they can expose their children to a phonics reading system.

Phonics reading systems were abandoned in the UK during the 1970s. Teachers who

persisted in phonics methods found themselves hounded and persecuted by the education bureaucracy.

A phonics technique, the "Spalding method", is being introduced to teachers in Australia. Spalding-trained teachers begin by teaching kindergarten pupils the 45 sounds of the English language, with the help of the 70 "phonogram" cards.

The results are speaking for themselves!

BRAIN pH LEVELS AFFECT INTELLIGENCE

A team of scientists led by Caroline Rae at the John Radcliffe Hospital, Oxford, UK, has discovered a link between IQ and pH in the brain's cortex. A higher, or more alkaline brain pH is likely to be associated with a higher IQ, according to tests measuring the acid content in the brains of 42 boys aged between six and 13.

It is the first time that intelligence has been linked to a biochemical 'marker' in the brain, raising the prospect that one day it may be possible to increase intelligence by artificially raising the pH levels in the brain.

The report reveals this was an accidental finding made during a study of children with muscular dystrophy. They were studying the possible correlation between brain biochemistry and intelligent behaviour.

PVC PHASE-OUT?

Will PVC (polyvinyl chloride) be the 'asbestos' of the '90s? Already, battle lines are being drawn between environment and health researchers, and the plastics industry and other organisations it funds.

The "Poisonous Plastics" article in this issue dives into some of the deeper considerations at stake. Meanwhile, we thought readers might like to know that several European countries, including Germany, Sweden, Switzerland and Austria, have instigated moves to phase out PVC at various levels.

WAS IT A MISSILE THAT HIT TWA FLIGHT 800?

Conspiracy theories are thriving amidst the deafening silence from authorities regarding the cause of the crash of TWA Flight 800.

What is adding fuel to this fire is the large number of eyewitnesses who accurately describe an object approaching the 747 just before it burst into flames. Consider the following:

- Many eyewitnesses heard a "sonic boom" which drew their attention skywards and resulted in their witnessing the explosion;
- CNN reported that a radar operator tracking Flight 800 saw on his screen another smaller blip approaching the 747;
- More than 100 eyewitnesses claim they saw an orange flame streaking towards the spot where the plane exploded;
- Two commercial airline pilots reported seeing a missile actually in flight;
- One person at a social event accidentally photographed an object streaking towards the jet. The FBI confiscated all photos except one, which has now been put onto the Internet (see Art Bell's web page).

All these reports suggest to military and intelligence experts that someone fired a "Stinger" missile at the plane. Due to its small weight and size, a Stinger can be carried, positioned and fired by a single person. It has a range of four kilometres and can reach speeds of Mach 2, or twice the speed of sound.

Researchers are worried that authorities will not reveal such a conclusion to the American public for fear of embarrassment, and fear of causing panic over air travel.

SECRET IMPLANTS ILLEGALLY USED ON PRISONERS

A leaked three-page document has surfaced recently which should make IBM's security division very unhappy. Reprinted below are the first two of those pages:

2020 NEURAL CHIP IMPLANT

The control of crime will be a paramount concern in the 21st Century. We must be ready with our security products when the demand for them becomes popular. Our Research and Development Division has been in contact with the Federal Bureau of Prisons, the California Department of Corrections, the Texas Department of Public Safety, and the Massachusetts Department of Correction to run limited trials of the 2020 neural chip implant. We have established representatives of our interests in both management and institutional level positions within these departments.

Federal regulations do not yet permit testing of implants on prisoners, but we have entered into contractual testing of our products. We have also had major successes in privately owned sanitariums with implant technology. We need, however, to expand our testing to research how effective the 2020 neural chip implant performs in those identified as the most aggressive in our society. Limited testing has produced a number of results.

In California, several prisoners were identified as members of the security threat group, EME, or Mexican Mafia. They were brought to the health services unit at Pelican Bay and tranquilized with advanced sedatives developed by our Cambridge, Massachusetts laboratories. The implants procedure takes 60-90 minutes depending upon the experience of the technician. We are working on a device which will reduce that time by as much as 60%. The results of implants on 8 prisoners yielded the following:

- Implants served as surveillance monitoring device for threat group activity
- Implants disabled two subjects during an assault on correctional staff

- Universal side-effects in all 8 test subjects revealed that when the implant was set to 116 MHz all subjects became lethargic and slept an average of 18-22 hours per day

- All subjects refused recreation periods for 14 days during the 116 MHz test evaluation

- 7 of the 8 subjects did not exercise, in the cell or out of the cell, and 5 of the 8 subjects refused showers up to three days at a time

- Each subject was monitored for aggressive activity during the test period and the findings are conclusive that 7 out of the 8 test subjects exhibited no aggression, even when provoked

- Each subject experienced only minor bleeding from the nose and ears 48 hours after the implant due to initial adjustment

- Each subject had no knowledge of the implant for the test period and each implant was retrieved under the guise of medical treatment

It should be noted that the test period was for less than two months. However, during that period, substantial data was gathered by our research and development team which suggests that the implants exceed expected results. One of the major concerns of Security and the R & D team was that the test subject would discover the chemical imbalance during the initial adjustment period and the test would have to be scrubbed. However, due to advanced technological developments in the sedatives administered, the 48-hour adjustment period can be attributed to prescription medication given to the test subjects after the implant procedure.

One of the concerns raised by R & D was the cause of the bleeding and how to eliminate that problem. Unexplained bleeding might cause the subject to inquire further about his "routine" visit to the infirmary or other health care

facility.

The security windfall from the brief test period was enormous. Security officials now know several strategies employed by the EME that facilitate the transmission of illegal drugs and weapons into their correctional facilities. One intelligence officer remarked that while they cannot use the information they have in a court of law, they know who to watch and what outside "connections" they have. The prison at Soledad is now considering transferring three subjects to Vacaville where we have ongoing implant research. Our technicians have promised that they can do three 2020 neural chip implants in less than an hour. Soledad officials hope to collect information from the trio to bring a 14-month investigation into drug trafficking by correctional officers to a close.

Essentially the implants make the unsuspecting prisoner a walking, talking recorder of every event he comes into contact with. There are only five intelligence officers at the Commissioner of Corrections who actually know the full scope of the implant testing.

In Massachusetts, the Department of Correction has already entered into high-level discussions about releasing certain offenders to the community with the 2020 neural chip implants...
